Key People Analytics Insights

1. High attrition despite high tenure
The organisation has an average tenure of 79 months (~6.6 years). Yet, the attrition rate stands at 40%. This suggests that while employees stay long-term, retention has become a recent challenge, with 4 exits in both 2023 and 2024.

2. Balanced gender representation across departments
All five departments show a perfect 50/50 gender split. This indicates strong diversity hiring practices. Even though the equal 40% attrition rate for both genders suggests retention issues affect everyone uniformly.

3. Declining hiring trend
Hires have decreased steadily from 3 per year in 2015 to just 1 per year in 2024. With 4 annual exits, the organisation is shrinking rather than growing. This may affect long-term sustainability.

4. Strong promotion culture
The promotion rate of 40% is robust, with 50% of employees receiving promotions in 2023-2024. However, this high promotion activity hasn't reduced attrition. This indicates that career growth alone may not address retention challenges.

5. Stable performance with room for improvement
Average performance rating is 3.4 out of 5, suggesting a competent but not high-performing workforce. With attrition removing experienced staff, maintaining this average may become difficult without targeted development programs.

Recommendation: Investigate root causes of attrition despite high tenure and promotion rates. Consider exit interviews and department-level retention strategies, especially given the declining hire rate.
